                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a variant of the C. pneumoniae polypeptide antigen, polypeptide A. C. pneumoniae strain YK41 was cultured and genomic DNA extracted to prep. a lambda gtl1 DNA library. The library was then screened with an anti-YK41 monoclonal antibody (MAb), which was prepd. by fusing spleen cells from a mouse infected with YK41 with myeloma P3/NS1/1-Ag4-1 to produce a MAb expressing hydridoma. The DNA obtd. was then fused with the expression vector pADA431 to give pCPN533alpha. The plasmid was used to transform an E. coli host, which was cultured to give the antigenic polypeptide, polypeptide A. Polypeptide A and primers and probes derived from its DNA can be used in assays for the detection of polypeptide A antibodies and DNA, respectively, useful in the diagnosis of C. pneumoniae infection. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also be prevented or treated
The present sequence is the dihydrofolate reductase (DHFR)/ C. pneumonipolypeptide antigen variant fusion protein. C. pneumoniae strain YK41 valued and genomic DNA extracted to prep. a lambda gtl1 DNA library. The library was then screened with an anti-YK41 monoclonal antibody (MAb), which was prepd. by fusing spleen cells from a mouse infected with with myeloma P3/NS1/1-Ag4-1 to produce a MAb expressing hydridoma The DNA obtd. was then fused with DHFR DNA and the expression vector pADA431 to give pCPN533T. The plasmid was used to transform an E. coli host, which was cultured to give an antigenic polypeptide fusion prote:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-OCT-2003
07-NOV-1996
The present sequence is the C. pneumoniae polypeptide antigen, polypeptide A. C. pneumoniae strain YK41 was cultured and genomic DNA extracted to prep. a lambda gtll DNA library. The library was then screened with an anti-YK41 monoclonal antibody (MAb), which was prepd. by fusing spleen cells from a mouse infected with YK41 with myeloma P3/NS1/1-Ag4-1 to produce a MAb expressing hydridoma. The DNA obtd. was then fused with the expression vector pADA431 to give pCPN533alpha. The plasmid was used to transform an E. coli host, which was cultured to give the antigenic polypeptide, polypeptide A. Polypeptide A and primers and probes derived from its DNA can be used in assays for the detection of polypeptide A antibodies and DNA, respectively, useful in the diagnosis of C. pneumoniae infection.                                                                                          The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable biochemical characterisation of proteins. ABO23500-ABO23617 represent outlier proteins identified from different pathogenic organisms
                                                                                                                                                                                                                                Identifying

                                                                                                                                                                                                                                                                                                               AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also be prevented or treated. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence is the dihydrofolate reductase (DHFR)/ C. pneumoniae peptide antigen fusion protein, polypeptide B. C. pneumoniae strain was cultured and genomic DNA extracted to prep. a lambda gtll DNA ary. The library was then screened with an anti-YK41 monoclonal body (MAb), which was prepd. by fusing spleen cells from a mouse ted with YK41 with myeloma P3/NS1/1-Ag4-1 to produce a MAb ssing hydridoma. The DNA obtd. was then fused with DHFR DNA and the sesion vector pADA431 to give pCPN533T. The plasmid was used to be peptide fusion protein, polypeptide B. Polypeptide B and primers and serived from its DNA can be used in assays for the detection of penic polypeptide antibodies and DNA, respectively, useful in the loss of C. pneumoniae infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       _

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WO200277183-A2.

      invention relates to an isolated nucleic acid comprising any one 6213 antisense sequences given in the specification where expressive nucleic acid inhibits proliferation of a cell. Also included a vector comprising a promoter operably linked to the nucleic acording a polypeptide whose expression is inhibited by the antisens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Ma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful in treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food geneplement. (II) and its binding partners are useful in medical imaging (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Ma

Typical of these conditions are Charcot-Marie-Tooth disease; Schwartz-Jampel syndrome; conditions are Charcot-Marie-Tooth disease; Schwartz-Jampel syndrome; crystalline corneal dystrophy, dentatorubral pallidoluysian atrophy and ataxia. These diseases, or susceptibility to them, can be diagnosed by detecting mutations in (II)-encoding genes and/or by measuring levels of (II). Cells that express (II), or their membranes, can be used to screen for specific (ant) agonists, potential therapeutic agents. (I), or its fragments, are used as probes to isolate related sequences; as reagents for research, diagnosis and drug screening; for chromosome identification (i); and for expressing recombinant (II). (II) and their fragments, are used to raise specific antibodies (useful for isolation and identification of (II), expressing clones, for purification of (II), as therapeutic antibodies; as assay reagents and in drug screening); in vaccines; to screen for (ant) agonists and to identify specific receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Ma

The invention relates to a modulates T lymphocyte act: cell comprising an A-raf-1 where the A-raf-1 or TCPT

n relates to a novel method for identifying a compound lymphocyte activation. The method comprises contacting ing an A-raf-1 or TCPTP/PTPN2 polypeptide with a compound raf-1 or TCPTP/PTPN2 polypeptide is encoded by a nucle

compound, a nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence selected from two 606-amino acid sequence and a 415-amino acid sequence given in the specification. The method of the invention has immunosuppressive, antiasthmatic, antiallergic, and antiinflammatory activity. The method is useful for identifying compounds that modulate lymphocyte activation and migration, and for monitoring changes in cell surface marker expression, cytokine production, antibody production, cell surface marker expression, cytokine production, antibody production, cell surface marker expression, cytokine production, antibody production, cell surface marker expression, and apoptosis, using either cell lines or primary cells. The A-raf- 1 or TCPTP/PTPN2 proteins may be used as condulation and migration, e.g. for the treatment of diseases in which modulation of the immune response is desired such as delayed type hypersensitivity reactions, asthma, allergies, graft versus host disease, can activate and chronic inflammation. Modulators of lymphocyte activation and migration. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Ma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a C polypeptide in tissue, as molecular weight markers and as a food Supplement. (II) and its binding partners are useful in medical imaging C of sites expressing (II). (I) and (II) are useful for treating disorders in involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in C diagnostics, forensics, gene mapping, identification of mutations C responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of data and products dependent on DNA and condition of sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in clectronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

(II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

ition relates to isolated polynucleotide (I) and polypeptide (II); (I) is useful as hybridisation probes, polymerase chain (PCR) primers, oligomers, and for chromosome and gene mapping, combinant production of (II). The polynucleotides are also used stics as expressed sequence tags for identifying expressed:) is useful in gene therapy techniques to restore normal of (II) or to treat disease states involving (II). (II) is or generating antibodies against it, detecting or quantitating a de in tissue, as molecular weight markers and as a food it. (II) and its binding partners are useful in medical imaging

            The invention relates to isolated polynucleotide (I) and polypeptide (sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also use in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorder involving aberrant protein expression or biological activity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          :chea
                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide diagnostics, forensics, generesponsible for genetic discbiodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                   20;
vention relates to isolated polynucleotide (I) and polypeptide (II) ces. (I) is useful as hybridisation probes, polymerase chain on (PCR) primers, oligomers, and for chromosome and gene mapping, recombinant production of (II). The polynucleotides are also used gnostics as expressed sequence tags for identifying expressed (I) is useful in gene therapy techniques to restore normal crown of (II) or to treat disease states involving (II). (II) is for generating antibodies against it, detecting or quantitating a pitide in tissue, as molecular weight markers and as a food ment. (II) and its binding partners are useful in medical imaging as expressing (II). (I) and (II) are useful for treating disorders pitide and polynucleotide sequences have applications in stics, forensics, gene mapping, identification of mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cand to produce other types of data and products dependent on DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ş
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Ma

The invention relates to isolated polynucleotide (I) and polypeptide (II)

Bequences. (I) is useful as hybridisation probes, polymerase chain

reaction (PCR) primers, oligomers, and for chromosome and gene mapping,

and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal

cuseful for generating antibodies against it, detecting or quantitating a

polypeptide in tissue, as molecular weight markers and as a food

supplement. (II) and its binding partners are useful in medical imaging

of sites expressing (II). (I) and (II) are useful for treating disorders

involving aberrant protein expression or biological activity. The

polypeptide and polynucleotide sequences have applications in

diagnostics, forensics, gene mapping, identification of mutations

responsible for genetic disorders or other traits to assess biodiversity

amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic

patent did not appear in the printed specification, but was obtained in

reaction (PCR) primers, oligomers, and for chromosome and gene mapping,

and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal

ctivity of (II) or to treat disease states involving (II). (II) is

useful for generating antibodies against it, detecting or quantitating a

polypeptide in tissue, as molecular weight markers and as a food

supplement. (II) and its binding partners are useful in medical imaging

of sites expressing (II). (I) and (II) are useful for treating disorders

cinvolving aberrant protein expression or biological activity. The

polypeptide and polynucleotide sequences have applications in

diagnostics, forensics, gene mapping, identification of mutations

responsible for genetic disorders or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and

mino acid sequences. ABG00010-ABG30377 represent novel human diagnostic

patent did not appear in the printed specification, but was obtained in

electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics are useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics are also used in diagnostics as expressed sequence tags for identifying expressed contivity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal consequent. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging convolving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

sequences. (I) is useful as hybridisation probes, polymerase chain (CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polymucleotides are also used CC in diagnostics as expressed sequence tags for identifying expressed CC genes. (I) is useful in gene therapy techniques to restore normal CC activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CC involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in CC ftp.wipo.int/pub/published_pct_sequences

Or security from WIPO at the printed specification of the sequence data for this content did not appear in the printed specification, but was obtained in the printed specification of the sequence data for this content of the sequences of the sequences of the sequences of the sequence data for this content of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                요.
                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of t printed specification, but was obtained in electronic format direct from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23-MAR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic a genes from Drosophila interactions.

The specification describes LGIC proteins designated LGIC ACO5-10, ACO5-11 and ACI5-4/ACI5-25. LGIC polynucleotic are useful for identifying a compound that modulates glutamate-related channel protein activity. The LGIC protein forms a forms homomultimer channel receptors which provide additional screening targets to identify modulators, which may act as effective insecticidal mitacidal and/or nematocidal treatment (i.e., active against parasitic, invertebrate species such as worms, fleas, tick and lice) for use in human health and/or crop protection. LGIC is useful as a novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        27-AUG-2003
31-JUL-1998
                                              The present sequence represents a fragment of a new Hepatitis g virus protein (see also AAW56441-50 for other fragments). RNA was synthesised from the serum of nine patients judged positive for Hepatitis g virus and CDNA synthesised from this RNA. The CDNA was used as a template in several PCR reactions to isolate fragments of the new gene. The gene may be useful for diagnosing and developing treatments for Hepatitis g virus diseases. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         che

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ontrolled anion channels which are useful in screening for l plant-protection agents and have insecticidal activity. The nalso describes the production of DNA constructs, vectors, host ntibodies and transgenic invertebrates which are also used in the cation of plant protection agents which alter the expression of nd controlled anion channel protein. The products of the n are also used to identify genes that encode polypeptides in insects. I polypeptides described in the specification are suitable for igh throughput assays. This sequence represents a liganded anion channel from the fruitfly Drosophila melanogaster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ξ

                                                                       Ş
                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cy enes. (I) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders (involving aberrant protein expression or biological activity. The diagnostics, forensics, gene mapping, identification of mutations constituted sequences of disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in clectronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food genement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The classostics, forensics, gene mapping, identification of mutations in diagnostics, forensics, gene mapping, identification of mutations cannot be for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in disgnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The golypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp...wipo.int/pub/published_pct_sequences

                                   This invention relates to a novel method for identifying isolated C polynucleotides that are modulated by post-transcriptional gene silencing C (PTGS). Specifically, it refers to the regulation of gene expression in C plants via PTGS and the trans-activation of homologous genes due to C increased RNA degradation. The present invention describes clusters of C polynucleotides from cereals, in particular rice, as well as homologues and the polypeptide sequences derived thereof, where gene expression is C altered in response to PTGS. As such, the elucidation of gene silencing C mechanisms can lead to more efficiently expressed transgenes, and can C also improve the understanding of plant-viral interactions and targeting C rice protein sequence that is modulated by gene silencing, given in an C exemplification of the invention. NOTE: This polypeptide sequence is a comparation of the invention. NOTE: This sequence does not appear in the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID=20030135888.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          26-SEP-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; Anti-inflammatory; Osteopathic; Neuroprotective; Nootropic; Gene Therapy; human; secretory protein; membrane proteins; cancer; inflammatory disease; osteoporosis; neurological disease.
                                                                                                                                                              The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                            New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for diseases which the gene is involved, or as target molecules for gene therapy.
                                                                                                                                                                                                                                        Claim
